Rough draft trans. of Metallovedeniye i [Termicheskaya] Obrabotka Metallov (USSR) 1957, no. 12, p. 31-36.

In nickel-molybdenum alloys containing 8.17 wt.-% Mo the initial stage of softening is determined by the recovery process, the temperature range of which decreases continuously and regularly with increasing degrees of preliminary plastic deformation; softening, accompanied by recrystallization treatment, takes place within a temperature margin of 100°C and is accompanied by selective recrystallization within a temperature margin of 25 to 50°C. With increasing Mo content the structure of the alloy becomes continuously finer for an equal degree of plastic deformation; a continuous in-
